Meera and the Content Backlog

The Founder

Meera Pillai runs Skinstinct, a D2C skincare brand she launched 18 months ago in Mumbai. The line is built around minimal-ingredient formulations - she spent two years at a pharma company before going independent, and that background shows in how she talks about her products: no vague wellness language, lots of references to actives, pH levels, and clinical trial data from ingredient suppliers.

Skinstinct is doing ₹14–16 lakh a month in revenue. Her customer base is 28–40 year old urban women who are tired of being sold to. They respond to founders who know their science. Meera knows this because she can see it in her data: the four LinkedIn posts she has actually published in the last eight months have a combined 47,000 impressions. Her last post - a seven-paragraph breakdown of why niacinamide concentration matters more than the percentage on the label - drove 340 profile visits in 48 hours and converted three wholesale enquiries.

She has 6,200 LinkedIn followers. She has not posted in eleven weeks.

The Problem

Meera captures content constantly. She has a habit of dropping messages into a Telegram channel she made for herself - observations from her manufacturing unit, reactions to customer DMs, things she reads at 11pm that make her think. She estimates she drops two to three notes a week. Over eight months, that's sixty captured fragments sitting in her phone.

None of them became posts.

She also has forty draft documents in a Google Drive folder. Most are started and abandoned within the first two paragraphs. The ones that made it to publishing took her between ninety minutes and three hours each - not writing time, she says, but stall time. She knows what she wants to say. She can't get herself to sit down and shape it.

> *"I open the doc, I write two lines, I decide it's not good enough, I close it. By the time I come back to it two weeks later, the moment has passed."*

She hired a content writer for six weeks earlier this year. The posts were grammatically clean and factually accurate. She spent more time rewriting them than it would have taken to write from scratch. She stopped after the fourth post.

What She Wants

Meera has a simple picture in her head. She keeps dropping these notes into Telegram - she's not changing that habit. What she wants is for something to pick up those notes, figure out which ones are worth developing, draft a LinkedIn post from the ones that are, and have it ready for her to look at. She'd also like the draft to reference something current - a news angle, an industry data point - so the post doesn't feel like it was written in a vacuum.

The target she's set herself: three posts a week, without it consuming her time.

She tried describing this to two different no-code consultants. Both came back with tools that could do the whole thing end to end. She passed on both of them.

What She's Providing

Meera has given you access to two folders:

notes/ - Sixty raw fragments: voice note transcriptions, half-finished observations, two-liners. Mixed quality, mixed topics. Some are strong. Some are not publishable in any form.

published/ - Fifteen pieces she wrote herself: four LinkedIn posts and eleven email newsletters sent to her subscriber list. This is the only voice reference you have.

Before You Come to Class on 23 Sept

Read this brief carefully. Using it as your source material, prepare the following and complete them before coming to class:

1. **Automation Brief**: Write down the 'Why' - Pain, User, Outcome, and The Journey Today

2. Nine Checks: Work through all nine checks with evidence from the case. Identify the Cut: the one thing Meera has described wanting that a check stops you from building.

3. **Components Map**: Map the workflow using the Trigger → Input → Context → Processing → AI → Output structure from your session notes. The blank template is in this document (Page 5).

4. **Telegram Bot Account**: Create a Telegram Account and one Bot on it.

The session on 23 Sept opens with your Automation Brief and Components Map. Come ready to defend both.

Skinstinct, Meera Pillai, and all associated data in this case are fictional. The business problems are constructed for learning purposes.
