

Case 1 — Automation Brief

Meera / Skinstinct

MESA AI AND ITS APPLICATIONS | FOUNDER'S OFFICE CASE | COHORT C4

The Problem Isn't "Writing LinkedIn Posts"

Meera captures ideas. She doesn't turn them into published posts.

60

Unused Voice Notes

Accumulated over 8 months — ideas captured, never acted on.

40

Abandoned Drafts

Started, doubted, shelved. The failure loop repeats.

11

Weeks Without a Post

Despite consistent idea capture — zero published output.

47K impressions from 4 posts · 340 profile visits + 3 wholesale enquiries from a single post

Goal → 3 publishable LinkedIn posts per week, under 15 minutes of Meera's active time.

The Nine Checks - Does this automation deserve to be built?

KILL SWITCHES

Any NO → don't build it

- 01 Problem Real
- 02 Workflow Repeated
- 03 Input Available

SIZING

Any NO → build something smaller

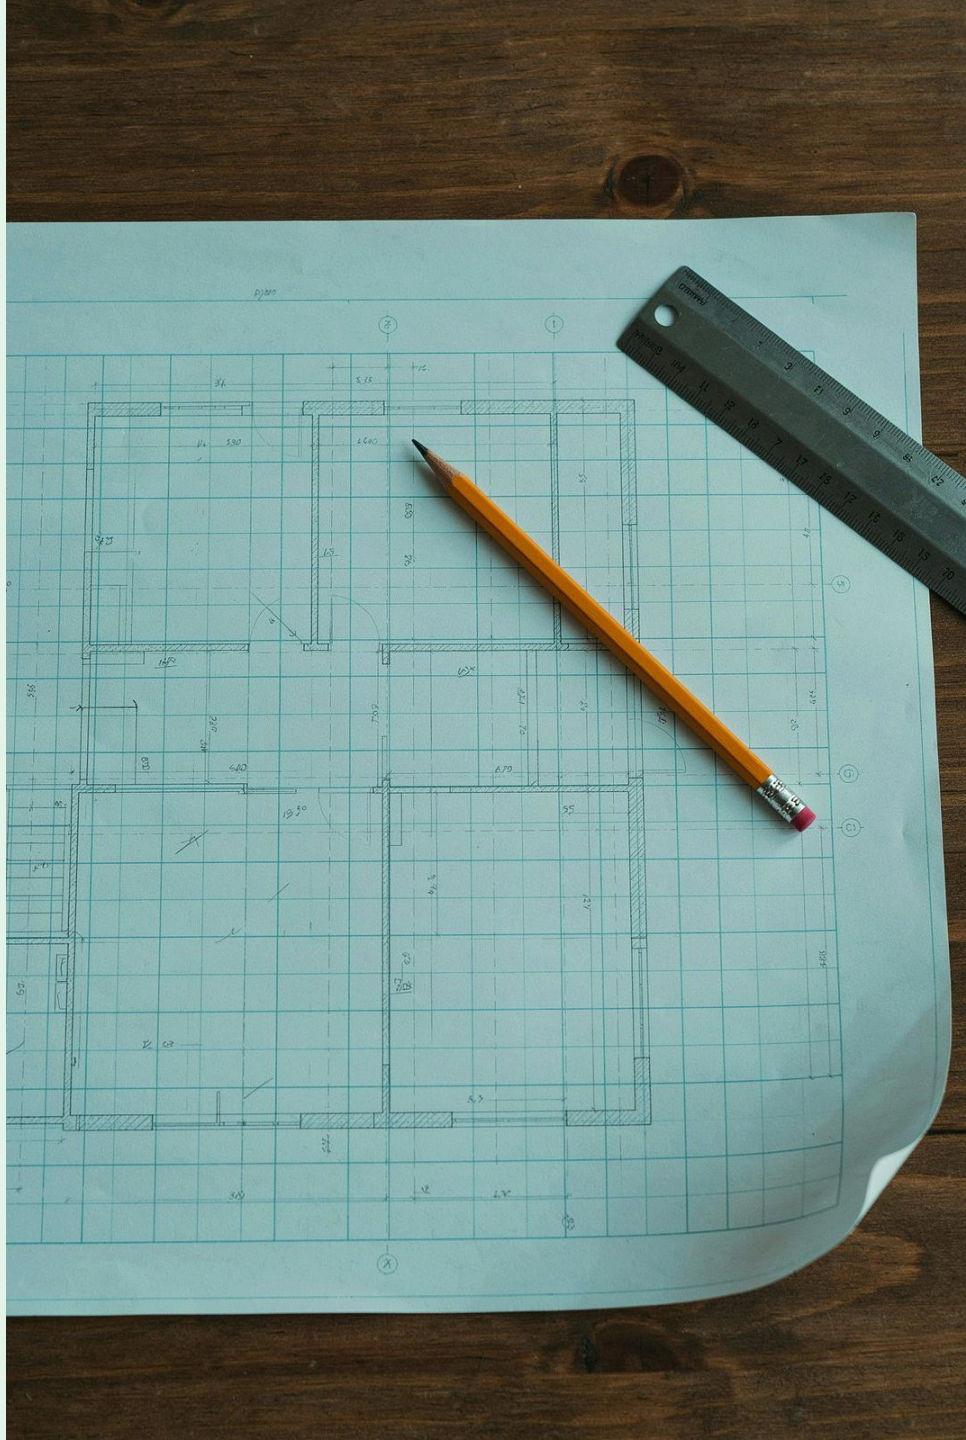

- 04 Output Valuable
- 05 Impact Measurable
- 08 ROI Worth It

BOUNDARY

Any NO → build the tool, human stays here

- 06 Failure Risk OK
- 07 Judgment Protected
- 09 Owner Clear

Reason through each check before revealing the answers.

The Nine Checks — Does This Deserve to Be Built?

⚡ Kill Switches

Any No means: don't build it.

- **01 Problem real? YES** - 60 unused voice notes, 40 abandoned drafts, 11 weeks without a post. Last post drove 340 visits + 3 wholesale enquiries.
- **02 Workflow repeated? YES** - 2–3 notes per week over 8 months. The failure loop repeats across 40 drafts.
- **03 Input available? YES** - Telegram active. 60 note fragments. 15 published pieces for voice reference.

📊 Sizing

Any No means: build something smaller.

- **04 Output valuable? YES** - 47,000 impressions from 4 posts. One post → 3 wholesale enquiries.
- **05 Impact measurable? YES** - Baseline: ~0.5 posts/month. Target: 3/week. Stall time: 90–180 min per post.
- **06 ROI worth it? YES** - 3 wholesale enquiries from one post = significant revenue. Build eliminates hours of weekly stall time.

🚧 Boundary

Any No means: put a human exactly here.

- **07 Failure risk OK? YES** - Nothing reaches LinkedIn without Meera's approval. Worst case: a bad draft she rejects.
- **08 Judgment protected? YES**
- **09 Owner clear? YES -** Meera reviews, edits, and publishes herself.

THE CUT

Meera wants to remain the author of everything published.

What Gets Automated

- Capture
- Scoring
- Drafting
- News research

What Stays Human

- Review
- Edit
- Publish

> The insight is not "don't automate" — it is **automate the workflow without automating away the human's consequential judgment.** Auto-scheduling removes that judgment at the most consequential step.

So What Gets Built?

Today

- Note sent
- Sits unused in Telegram
- Abandoned draft created
- Nothing published

Target Workflow

- Voice note → Telegram
- System screens and scores
- Draft written in Meera's voice
- HUMAN REVIEW GATE — Meera approves & publishes

By End of L3

Meera sends a note to Telegram and receives a draft in her voice.

By End of Build

The pipeline screens notes, adds a news angle, and stores everything for Meera to approve.

The Stack — One Job Per Tool

Claude (browser)

Builds the Voice Skill — no code, before anything else is touched.

Claude Code

Where the project lives and gets built end-to-end.

Gemini

Reads the Voice Skill and writes the draft in Meera's style.

Telegram

Where Meera sends notes in and receives drafts back.

Vercel

Puts the project live online.

GitHub

Saves progress between every session.

The stack is deliberately modular: capture, intelligence, memory, and deployment have separate jobs.

Checkpoint L3·1 - Build the Voice Skill

1 Open Claude

In the browser — no code required.

2 Paste the published/ folder

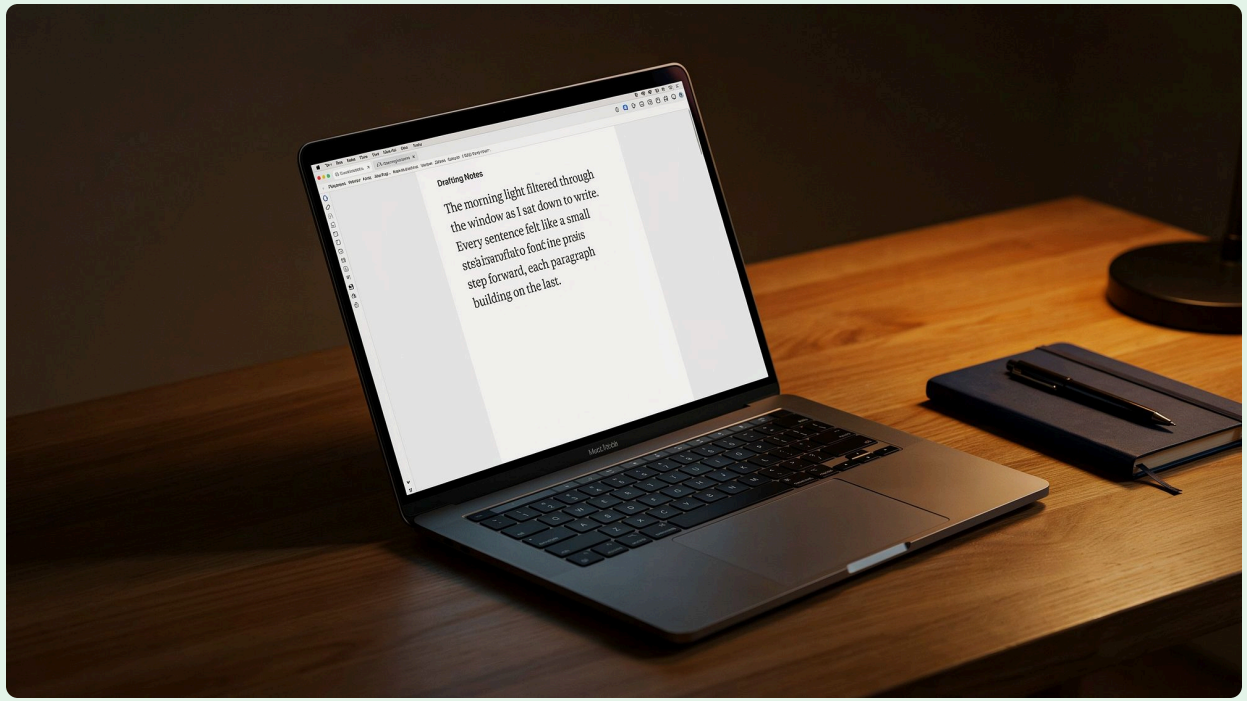

4 LinkedIn posts + 11 newsletters.

3 Ask Claude to analyse the founder's voice

How she opens · sentence length and rhythm · use of data/evidence · what she never says · how personal she gets.

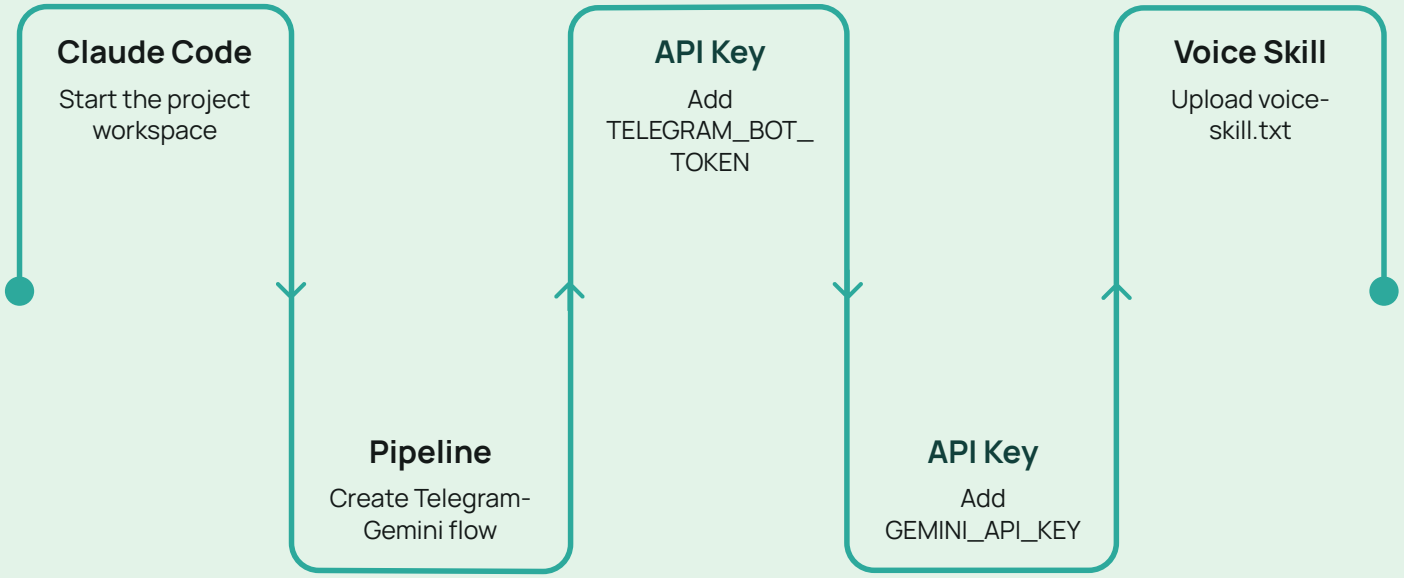

4 Save the result

voice-skill.txt

DONE WHEN: The voice profile feels specific to Meera - not generic writing advice.

Checkpoint L3·2 - Build the Project

Build the full pipeline step by step inside Claude Code. Each credential unlocks the next connection in the chain.

Security: .env stays private. Confirm it is listed in .gitignore before pushing.

DONE WHEN: Vercel shows the project is live.

Checkpoint L3·3 - Connect & Test

CONNECT: Telegram → Webhook → Vercel

Telegram needs to know where to send incoming messages.

```
https://api.telegram.org/bot[TOKEN]
/setWebhook?url=[VERCEL_URL]/api/webhook
```

Expected response: **"ok": true**

TEST: Strong note → Telegram → draft

Send a real note. Read the draft back. Ask: **Does it sound like Meera?**

If the draft feels generic: check whether `voice-skill.txt` is reaching Gemini on every call.

⚠ **Before leaving the room:** push to GitHub.
