Prompt

I am building a movie and TV show matchmaker for two people who can never agree on what to watch tonight, so they can stop scrolling, stop negotiating, and actually watch a movie/TV show that both of them like - with exactly where to watch it in India, right now.

HOW IT WORKS

Partner A opens the app and sets their preferences:
- Mood (multi-select): Light & fun / Intense & gripping / Scary / Romantic / Other
- Mood (optional free text): "Describe what you're in the mood for tonight" - used to further refine results
- Language (multi-select): Hindi / English / Tamil / Telugu / Kannada / Any - selecting Any deselects all others
- Content type (single-select): Movies only / Include series
- Minimum IMDb rating (single-select): 6+ / 7+ / 8+ / 9+ - show a subtle caveat next to 9+ saying "very few titles"
- Era (multi-select): Any / Classic (pre-2000) / 2000–2020 / Recent (2021–2026) - selecting Any deselects all others

The app generates a QR code that Partner A shares with Partner B. Partner B scans it and lands in the same session. If scanning doesn't work, a shareable link is the fallback. The app should also allow Partner A to share the QR code as an image directly from the app to any messaging app on their phone.

Partner B fills in the same preference form independently, without seeing Partner A's answers.

When both have submitted, Claude reads both preference profiles - structured inputs and free-text mood descriptions together - and generates a refined search brief. The app uses this brief to pull 30 titles from TMDB that satisfy both sets of preferences from the start, including the mood nuance from the free-text fields.

Both partners are then shown the same 30 titles as swipeable cards - swipe right to like, swipe left to pass. Each card shows the poster, title, year, IMDb rating, runtime, and a one-line synopsis. The order is randomised differently for each partner.

When a match is found, both screens show the match simultaneously - with the title's full details and exactly which Indian OTT platforms it is currently available on, with a direct link to each.

If both partners finish swiping with no matches, Claude reads both right-swipe lists from this round and generates a new pool of 30 titles that leans into what both partners actually responded to - deduplicated against titles already seen. One more round of swiping. If there is still no match after round two, show the top 5 titles by combined right-swipe score and let both partners make the final call together.

The app saves the full session to the database - both preference profiles, the full swipe history, the match, and a rating they can add after watching. Every time they return, their history is loaded and the title pool is refined based on what they've actually enjoyed together versus what they thought they'd enjoy.

The app needs four external connections:
- Claude to refine the title pool using mood descriptions and improve recommendations over time using watch history
- TMDB to fetch titles, posters, ratings, and metadata
- Rapid API to check which Indian OTT platforms each title is on right now
- A database (connect to Supabase) to store session history and swipe data

All API keys must be stored securely as environment variables, never in the code itself.

DESIGN PHILOSOPHY

The app should feel like something a real product team built - clean, mobile-friendly, and fun without being childish. The swiping mechanic should feel smooth and satisfying. Each card should give the title enough space to make a case for itself. The match moment should feel like an event - not just a result. Keep it simple. Every element on screen should earn its place.

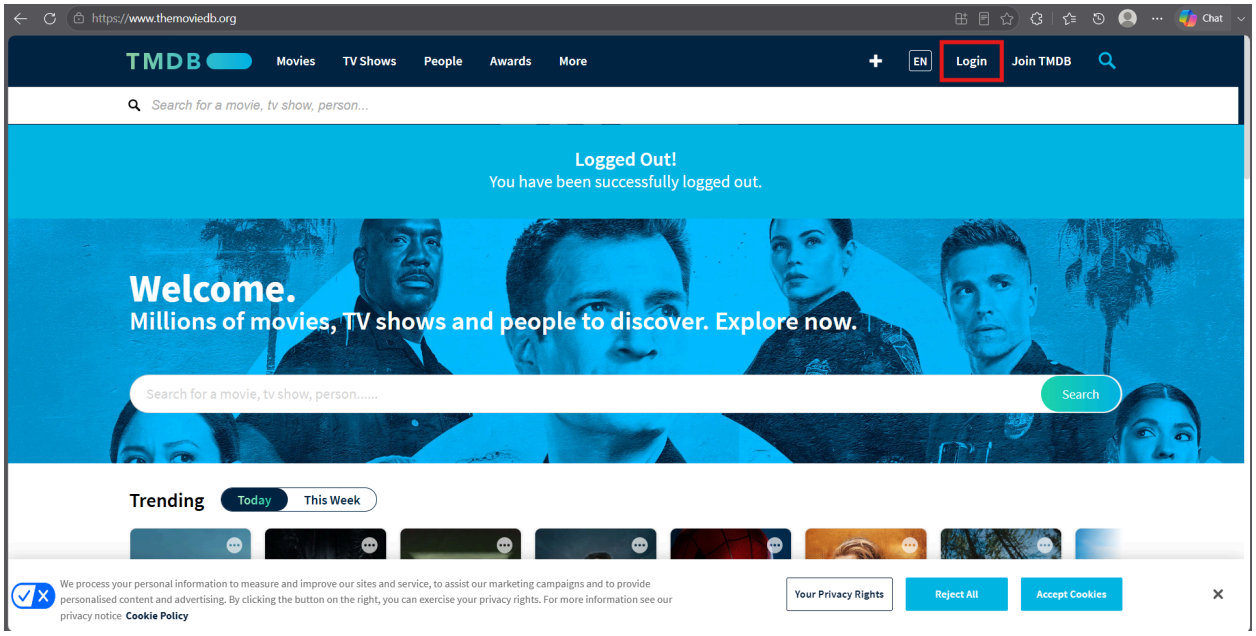

Instructions - TMDB API

Getting Your TMDB API Key

What is TMDB?
The Movie Database (TMDB) is a free, community-built database of movies and TV shows. We're using their API to pull movie posters, ratings, genres, and metadata into our app.

Step 1: Create your TMDB account

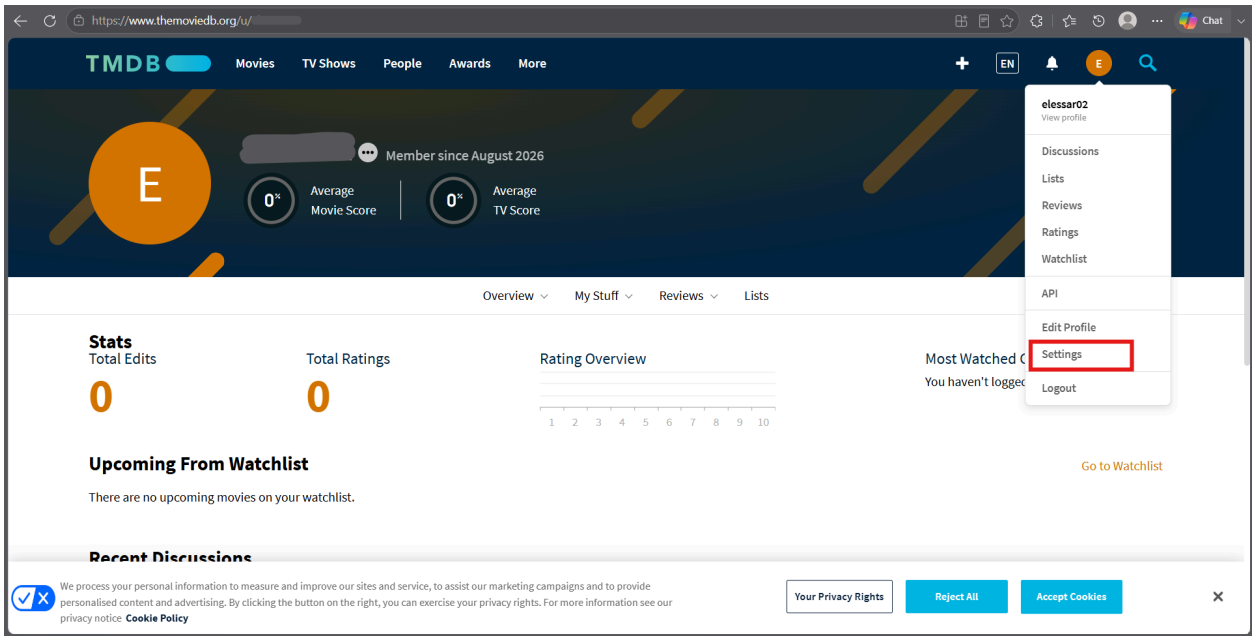

Head to themoviedb.org and sign up. You can use your Google account or create one with your email.

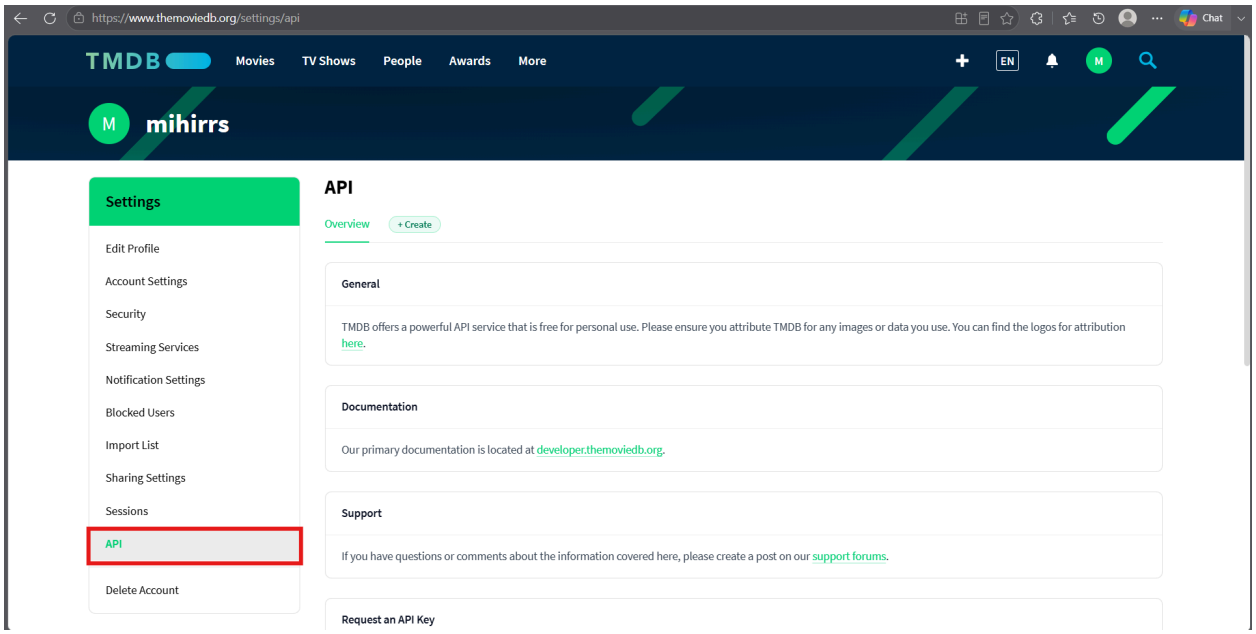

Once signed up, verify your email (check Spam folder if you don't see a confirmation email from TMDB in the Inbox of your Registered Account) before moving to the next step.

Step 2: Go to your API settings

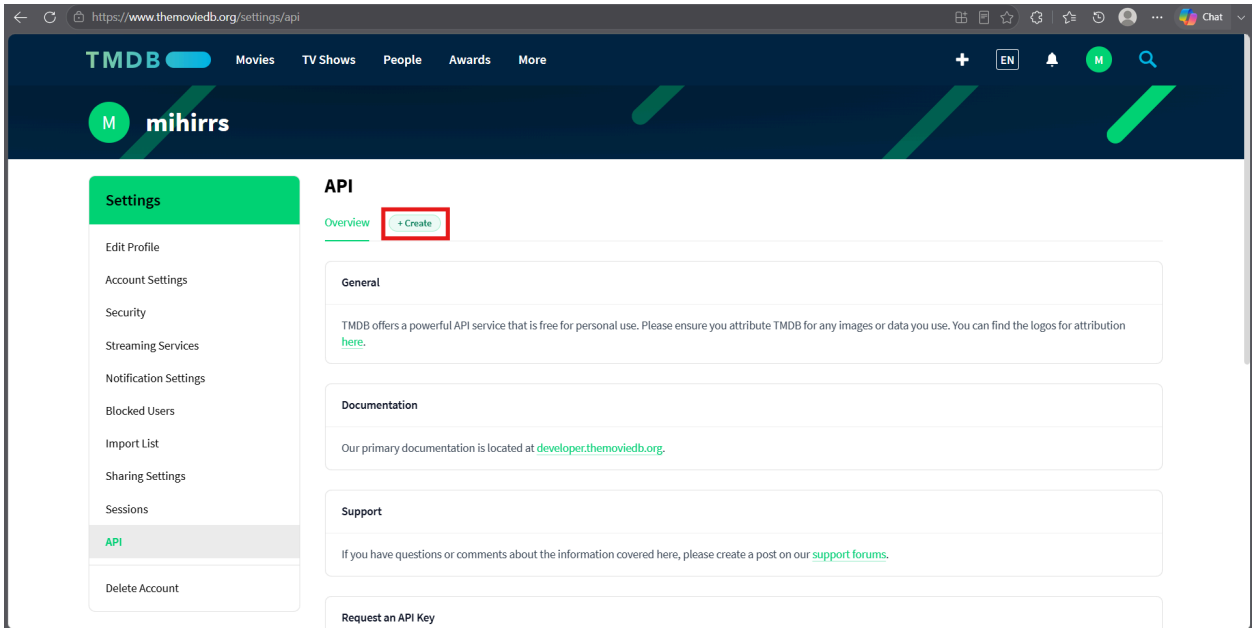

Once logged in, click on your **Profile** icon at the top right → **Settings** → **API** in the left sidebar.

Step 3: Request an API Key

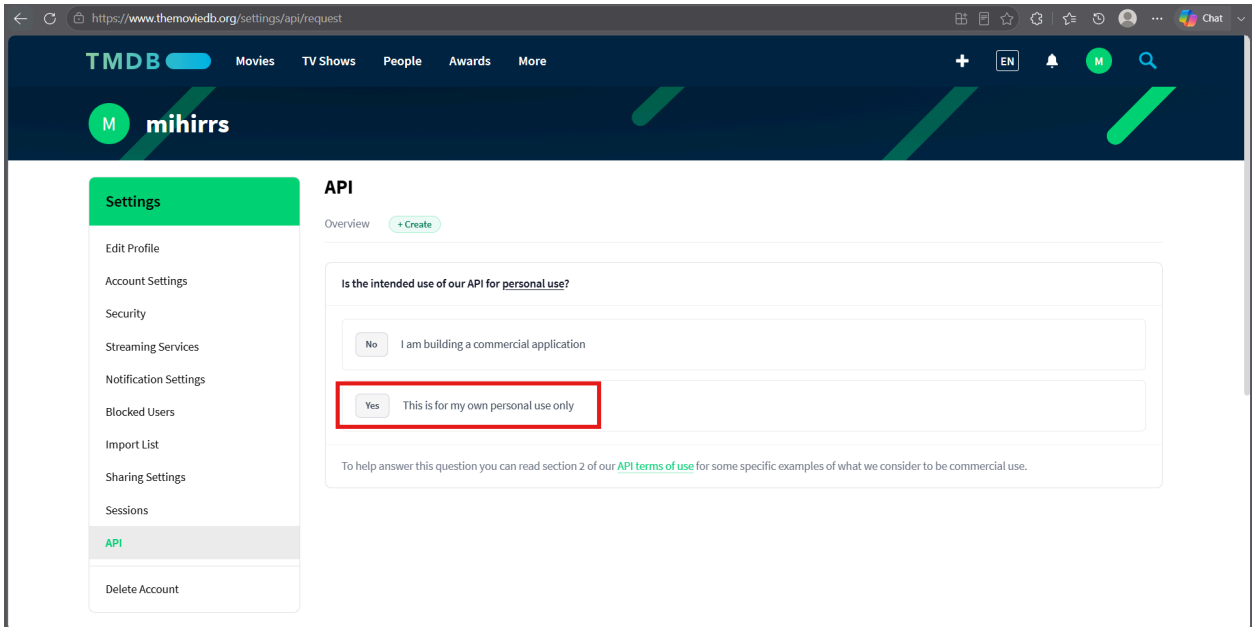

Click **Create** or **Request an API Key**. When prompted to choose a type, select **Developer**. Accept the terms of use.

Step 4: Choose personal use

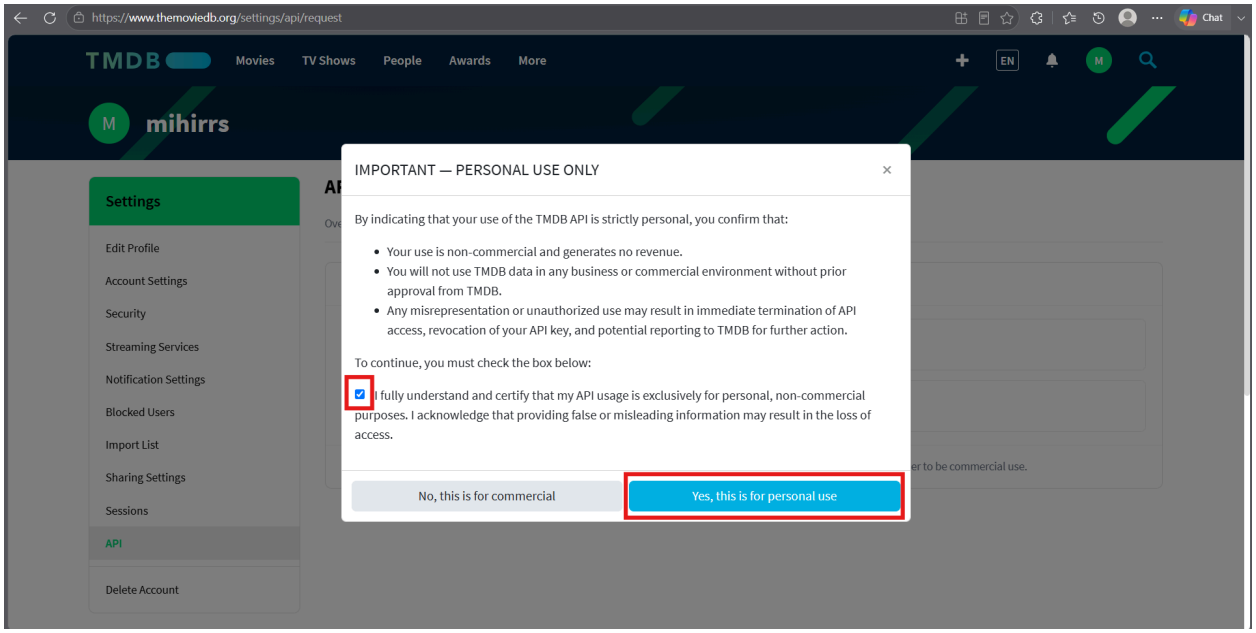

After clicking **+ Create**, you'll be asked: *"Is the intended use of our API for personal use?"*

Select **Yes - This is for my own personal use only.**

Step 5: Confirm personal use

A popup will appear titled **IMPORTANT — PERSONAL USE ONLY.** Read through it, check the confirmation box, and click **Yes, this is for personal use.**

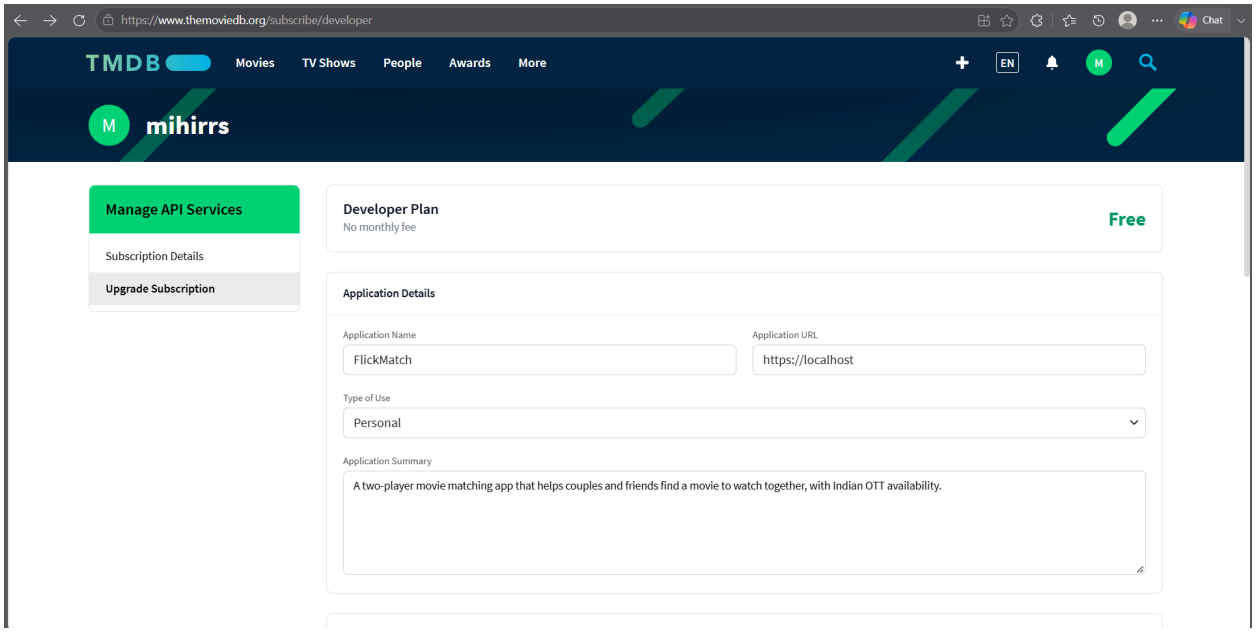

Note: This is a learning project, so personal use is the right selection here. If you ever build this into a commercial product down the line, you'll need to apply for a commercial API key separately.

Step 6: Fill in the application form

You'll see a short form. Here's exactly what to put in each field:

- **Application Name:** FlickMatch
- **Application URL:** You can put your a deployed URL here if you have it, or just type `https://localhost` if you don't have one yet
- **Type of Use:** Personal
- **Application Summary:** A two-player movie matching app that helps couples and friends find a movie to watch together, with Indian OTT availability.

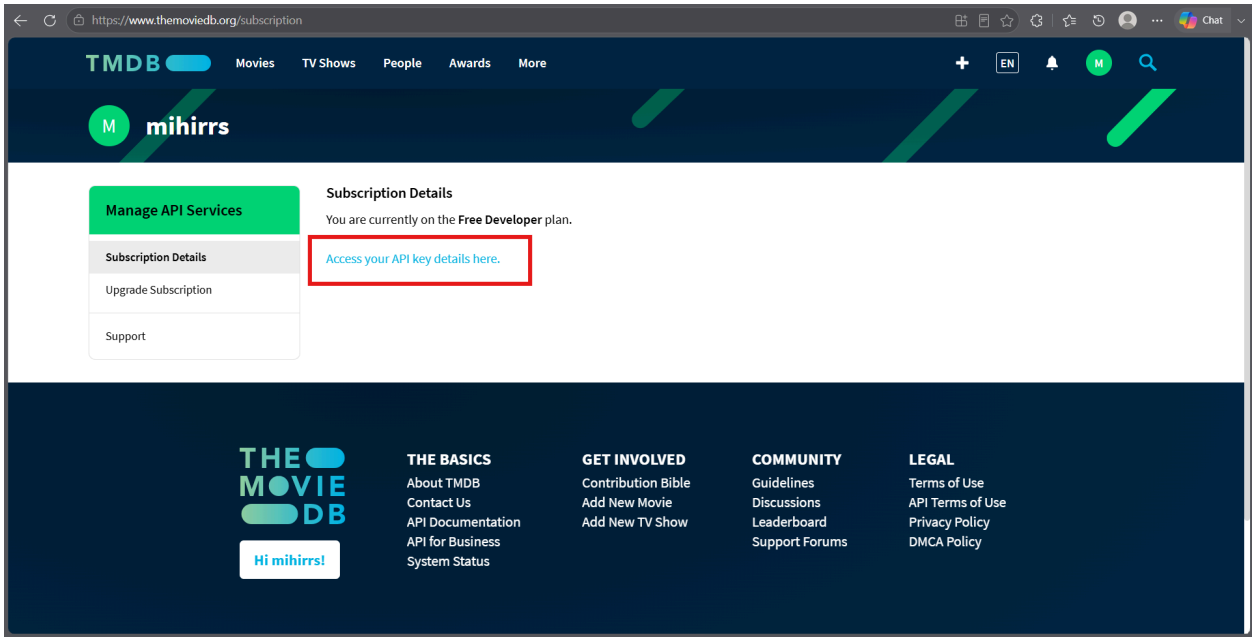

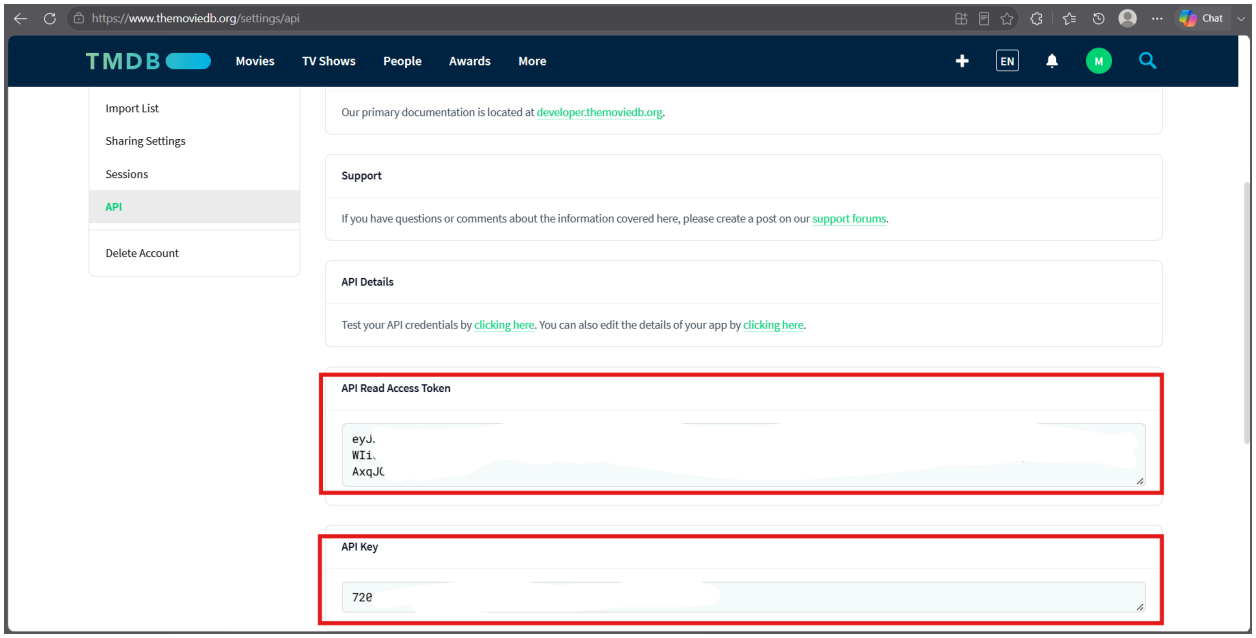

Enter your **Contact Info** below the **Application Details**.

Hit **Subscribe** and your key will be generated instantly.

Step 7: Copy your API Read Access Token

On your API settings page you'll now see two credentials. You want the **API Read Access Token** - it's the long one - and the **API Key**. Copy it.

Step 8: Save It in Notes

Save the **API Read Access Token** and the **API Key** in a Notes file. We will need these while building the application logic.

You're all set with TMDB. ✅

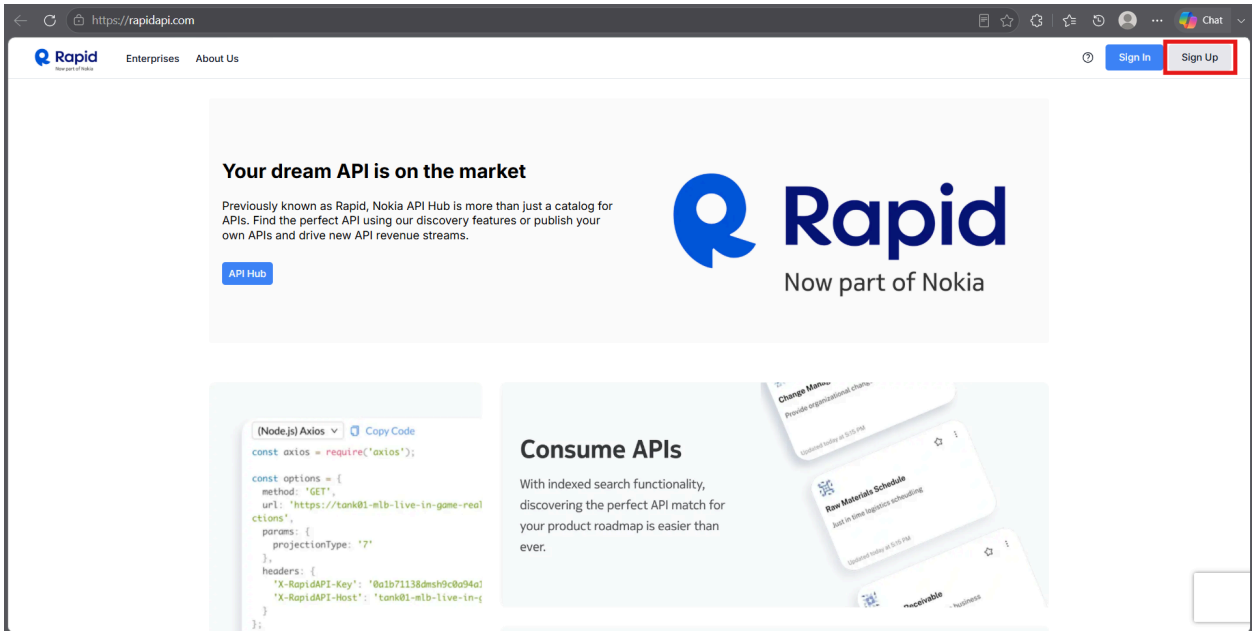

Instructions - RapidAPI

Getting Your RapidAPI Key (OTT Details)

What is RapidAPI?
RapidAPI is a marketplace for APIs. The OTT Details API — which we're using to check which Indian streaming platform a movie is available on — lives here. One RapidAPI account gives you one key that works across all APIs on the platform.

Step 1: Create your RapidAPI account

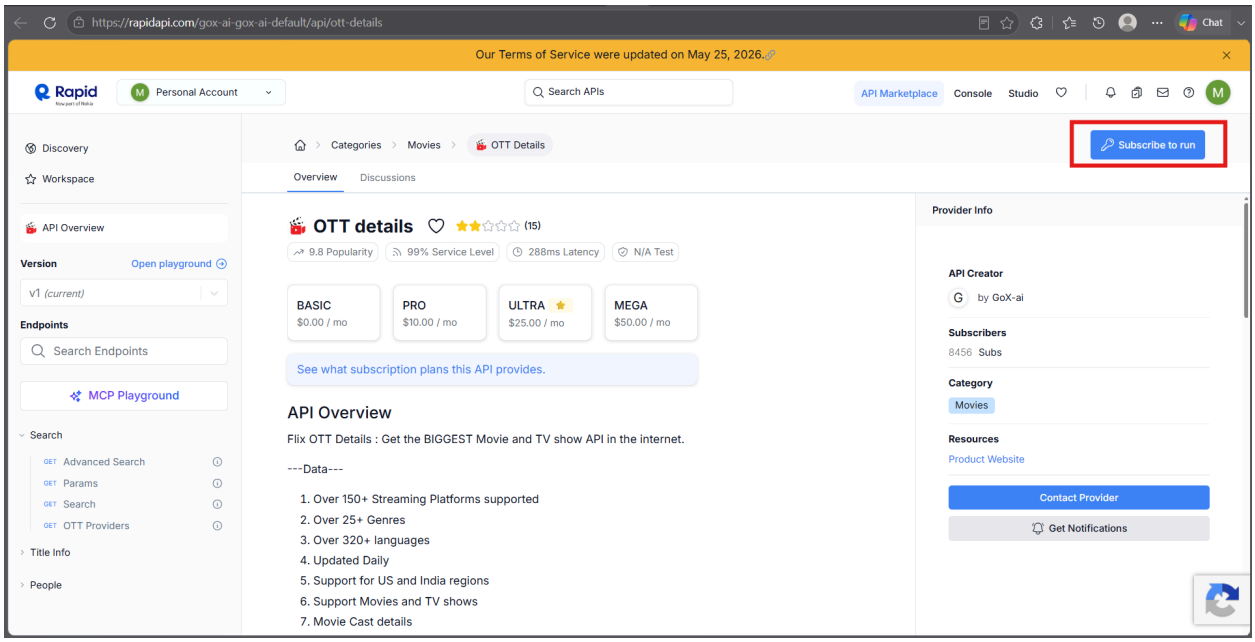

Head to rapidapi.com and sign up. Google signup works fine.

Step 2: Find the OTT Details API

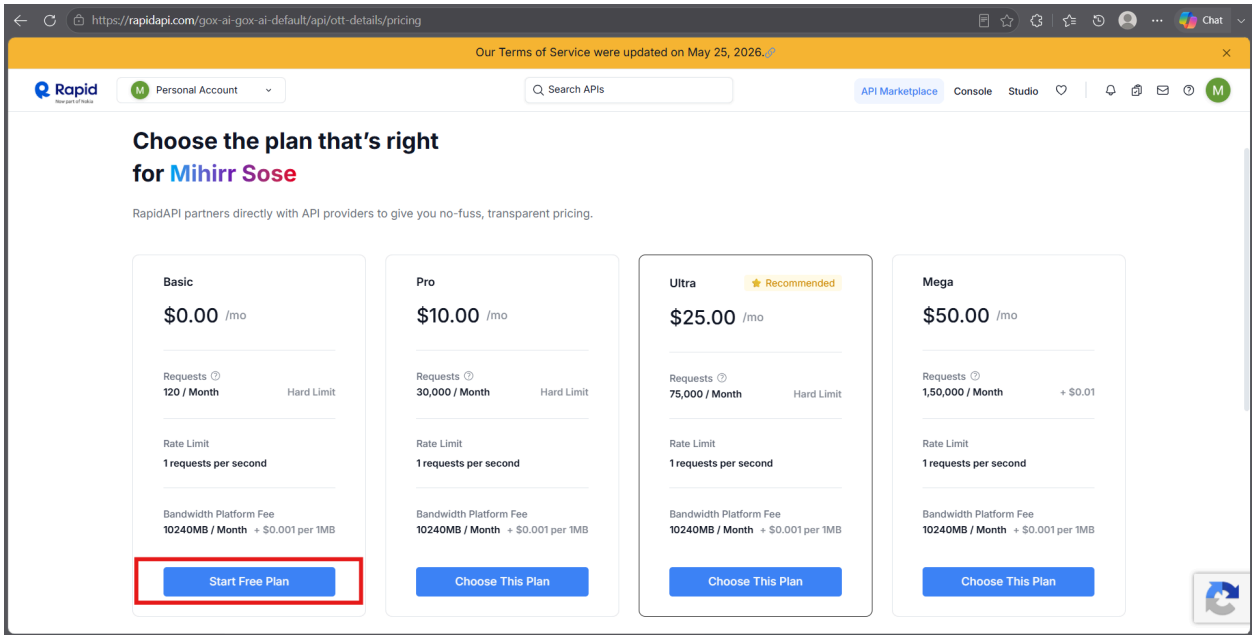

Once logged in, go directly to:
rapidapi.com/gox-ai-gox-ai-default/api/ott-details

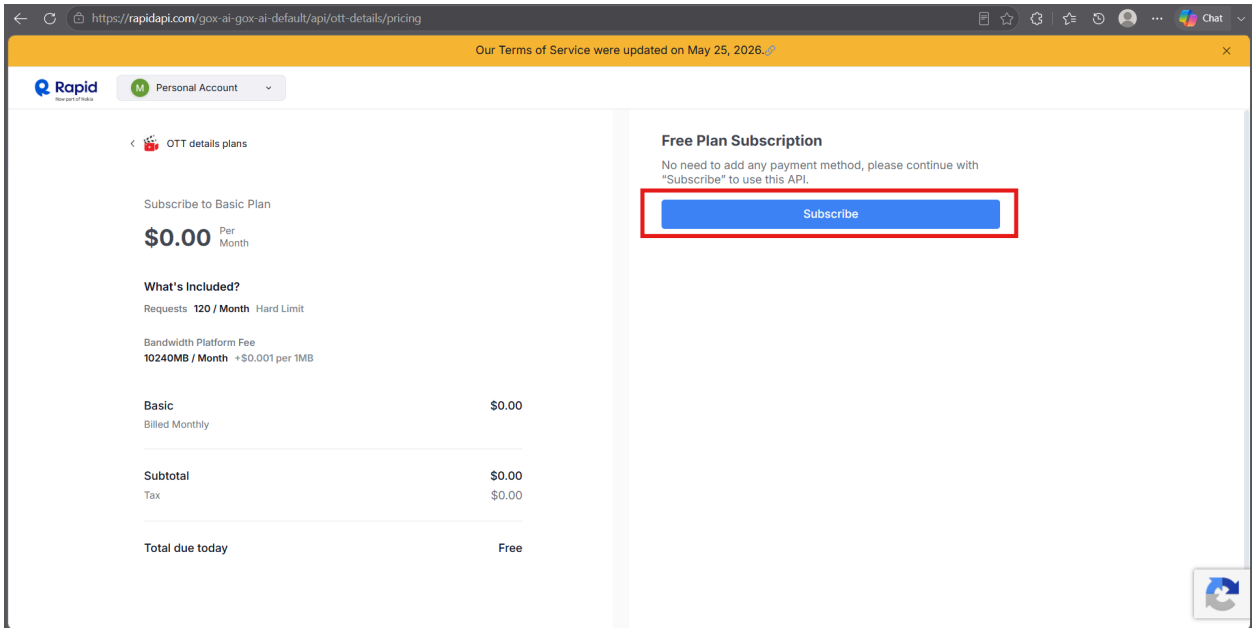

Or search **"OTT Details"** in the RapidAPI search bar and select the one by **gox-ai**.

Step 3: Subscribe to the free tier

Click **Subscribe to Run** → select the **Basic (Free)** plan → confirm.

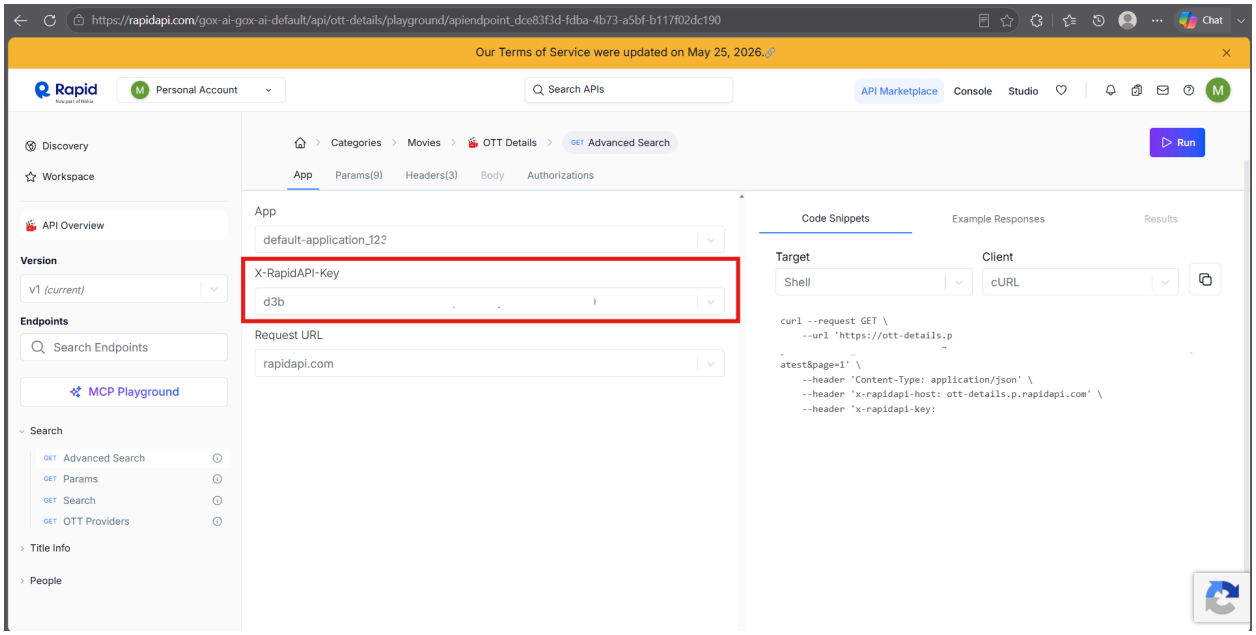

You won't need a credit card for the free tier.

Step 4: Copy your RapidAPI Key

Once subscribed, you'll land on the API's endpoint page. On the right side, you'll see a code snippet panel. Look for the header that says **X-RapidAPI-Key** - that value is your key. Copy it.

Note: This is your universal RapidAPI key - it's the same key for every API you use on RapidAPI. If you already have an account, you already have this key.

Step 5: Save it in Notes

Save the **X-RapidAPI-Key** value in a Notes file. We will need it while building the application logic.

You're all set with RapidAPI. ✅
