Introduction to Business Frameworks
Session - 3

12th September, 2026

Mesa
SCHOOL OF BUSINESS

Agenda

1 TID - The next product

2 Zylabs - Personalized B2B sales

Mesa
SCHOOL OF BUSINESS

TID - The crux of the case

Distribution → Customer → Product → Economics → Experiment → Flywheel

Mesa
SCHOOL OF BUSINESS

The Opportunity: From Audience to Business

TID has built distribution — now what should it build on top of it?

- 204K+ YouTube subscribers | 70K Instagram | 33K LinkedIn
- Audience: founders, operators, CXOs + students
- Today: monetized primarily through sponsorships
- Sponsorship = linear monetization of audience attention
- Product = opportunity for compounding monetization

How can TID monetize its audience without compromising founder time or audience trust?

Starting With the Customer, Not the Product

204K subscribers ≠ 204K customers; User ≠ Buyer ≠ Beneficiary

- Who cares enough to pay?
  - Students
  - Operators
  - Founders
  - CXOs
- Who has the highest willingness + ability to pay?
- What painful problem do they already spend money solving?

The opportunity is likely to be strongest where TID's credibility + audience + network intersect with a high-value problem.

Choosing a Product Where TID Has a Right to Win

Willingness to pay × Right to win × Revenue potential × Founder-time efficiency × Flywheel impact

Product	Buyer	TID advantage
Founder community	Founders/operators	Network + access
Executive program	CXOs/operators	Credibility + content
Research/intelligence	Companies/investors	Proprietary conversations
Dealflow platform	Investors	Founder network
Venture studio	Founders/investors	Network + Ventures

Deciding what TID can uniquely build that people will pay for?

Mesa SCHOOL OF BUSINESS

Estimating & Proving the Economics before build

Revenue estimation —› hypothesis → 90-day test

- Revenue = Reachable audience × Conversion × Price
- Key hypothesis will be developed on each of the factors
- 90-day test to validate hypothesis based on behavioural evidence:
  Hypothesis → Paid offer → Behavioural test → Scale / Kill
    - Landing page
    - Actual price
    - Waitlist/application
    - Deposit or payment
    - Small targeted audience

Mesa
SCHOOL OF BUSINESS

The Final Decision: Does It Strengthen TID?

Is TID merely extracting value from its audience — or building a stronger business around it?

- **Economics** - Does it generate enough contribution to justify the effort?
- **Founder time** - How many hours does Abhay need to invest — and what does he give up?
- **Trust** - What happens if the product disappoints the audience?
- **Flywheel** - Does it create better:
  - Guests
  - Stories
  - Dealflow
  - Network
  - Audience engagement

Crux of the case

The real value isn’t knowing more about a company. It’s knowing something useful enough to change what the seller does next.

Zylabs: Personalization at Scale in B2B Sales

- Consumer companies personalize using behavioral data: clicks, searches, purchases, repeat visits
- B2B sellers don't have the same visibility into organizational buying behavior
- Zylabs' promise: help sellers call fewer companies and be right more often
- Two challenges:
  - Q1: Evidence — What can we know about a company from the outside?
  - Q2: Belief — How do we convince sellers that this is a problem worth solving?
- What replaces the behavioral "fingerprint" in B2B?
  - Consumer personalization
    - Behavior → Data → Prediction → Recommendation
  - B2B personalization
    - ??? → Evidence → Interpretation → Account hypothesis → Seller action

Mesa SCHOOL OF BUSINESS

What can we know about a company from the outside?

Data known to everyone isn't differentiation

Signal	Example	Likely value
Firmographic	Revenue, industry, geography	Low
Structural	Funding, expansion, acquisition	Medium
Behavioral proxy	Hiring patterns, technology changes, website changes	Higher
Intent/problem signal	**Evidence of a specific emerging business problem**	**Highest**

What makes a signal genuinely valuable?

- Predictive
- Non-obvious
- Timely
- Repeatable
- Actionable

Mesa SCHOOL OF BUSINESS

Going from Data → Intelligence → Action

A pile of facts is not intelligence.

- Raw evidence → Signal detection → Context + interpretation → Account hypothesis → Personalized message → Seller action
- Key distinction
- Data: “Company X hired 50 salespeople.”
- Intelligence: “Company X’s rapid GTM expansion may indicate an emerging sales productivity / account-prioritization problem.”
- Action: “Prioritize Company X and approach the CRO with this specific hypothesis.”

The Belief Problem: Selling to the Unaware

Who does the seller believe when they don't believe the vendor?

- What does the experienced seller think?
  - "I lost the deal because of…"
    - Price
    - Timing
    - Competitor relationship
    - Product fit
    - Procurement
- What does Zylabs want them to consider?
  - "Could I have identified the right account — and the right problem — earlier?"

Evidence from lost deals

→ Identify recurring patterns
→ Find previously invisible signals
→ Show that signals existed before the deal
→ Demonstrate how earlier action could have changed the outcome

Relying on indicators vs reply rates

Pipeline takes months and reply rates can move for many reasons.

- Leading indicators
  - Did sellers accept the recommendation?
  - Did account priorities change?
  - Did messaging change?
  - Did sellers contact accounts they otherwise wouldn't have?
  - Did qualified meetings increase?
- Lagging indicators
  - Opportunities
  - Pipeline
  - Conversion
  - Win rate
  - Sales-cycle duration
  - Revenue per seller

B2B personalization requires two systems:

1. Evidence architecture
External signals → intelligence → prediction

2. Belief/adoption architecture
Insight → credibility → behavior change → business outcome

Q&A
